

Code of Conduct

Group 7 - besr | evaf | madbo | patj | rebp - March 6th, 2023

● Working Policy

We expect to write our code in IntelliJ.

We have agreed upon a weekly physical meeting where we discuss major changes, plans or problems. Otherwise the meeting will be a simple, formal status update from every group member.

An online meeting will be held in-between every physical meeting. If nothing that needs longer discussion has come up, that meeting might be skipped in favor of just using text-based communication over discord.

If anyone ever runs into any problems we expect that the person contacts the others and asks for help, there's no need to struggle on your own when another person might sit with the perfect solution. We also expect to handle possible conflicts this way: by talking in person and maybe making an extra meeting if it's necessary.

Programming tasks will be assigned individually for the smaller tasks, while we will group up for the more complex or difficult parts. For smaller tasks, we will actively have updates on the progress on that specific task through discord.

We will try to spend our time effectively, thus maximizing the time we spend working on the project rather than discussions and debates over pointless topics.

● Expectations

We expect each other to live up to the working policy to the extent which is possible and viable.

Furthermore we expect that we do the work which is required for the different tasks, but not at the expense of sitting for 15 hours working on something. Instead it would be preferred that it is communicated to the group that

something is difficult, such that the task can be done in a timely manner without cutting too many corners.

For the project we expect to end up with a result which is satisfactory for all group members and reflects the hours we have put into the project.

● Progress Plan

We are aware of the nature of a bigger project in that it is difficult to predict which challenges we will face. This is therefore only suggesting a way to keep the end product in mind during the process. The numbers refer to the numbered weeks of the Danish calendar and have been made with the outline for the course in mind.

Week 10: Create code of conduct, set expectations and establish a connection to the assigned TA

Week 11: Foundation of the project, collect and connect the things we've seen in the lectures, create smaller goals and maybe create an order in which we wish to implement the different features?

Week 12-16: Working on the project and coding.

Week 17: Have a functioning project that lives up to the project description

Week 18: Polishing of the code and start of the report

Week 19: Working on the report.

Week 20: Polishing of the report and submission
